

A SOLUTION TO ATTRIBUTE-BASED ASSIGNMENT PROBLEMS:
A PRIMER TO THE UNIVERSITY TIMETABLING PROBLEM

BY

FOLARIN WASIU JUNIOR

MTH/2014/014

A PROJECT SUBMITTED TO THE DEPARTMENT OF MATHEMATICS,
FACULTY OF SCIENCE,
OBAFEMI AWOLOWO UNIVERSITY, ILE-IFE, NIGERIA
IN PARTIAL FULFILMENT OF THE REQUIREMENTS FOR THE
AWARD OF BACHELOR OF SCIENCE (B.Sc Hons) DEGREE IN
MATHEMATICS

FEBRUARY, 2019

CERTIFICATION

I certify that FOLARIN, Wasiu Junior has fulfilled all requirements for the award of B.Sc (Hons) Degree in Mathematics. This project is the result of the research work carried out by him under my supervision during the course of his undergraduate studies in the Department of Mathematics, Obafemi Awolowo University, Ile-Ife, Nigeria.

Dr. B. S. Ogundare
Supervisor

Dr. O. P. Layeni
Head of Department

Date

DEDICATION

This work is dedicated to the Creatives among us and all those who have a deep and rather insatiable love for the world of logic, analytical reasoning and critical thinking...

May all the good dreams come to fruition!

ACKNOWLEDGEMENT

Great acknowledgement to the Most High: The ONLY Wise One. And to my family, friends and colleagues for their much love. And specially to my Supervisor, Dr. B. S. Ogundare, for giving me the freedom and support to develop the techniques presented in this work.

ABSTRACT

In this work, we take a mathematical exploration of certain assignment problems involving assigning a set of objects to non-overlapping subsets (partitions), in which assignment is based on certain properties possessed by the objects and the partitioning sets. Putting this in perspective, we attempt to solve a sample NYSC assignment problem. The algorithm is developed in this work, and certain notes on improvement cited. We also attempt to generalize this technique to the more general and complex University Timetabling problem.

Chapter 1

Introduction

In introducing this study, we shall proceed under the following sub-headings:

- Preamble
- Motivation
- A Sample Problem
- Objective of the study

1.1 Preamble

In everyday human, corporate and industrial activities, we are faced with the challenges of optimal resource assignment. In the face of limited resources, low tolerance for scrap and rework, need for greater degree of accuracy and scalability, optimization of resources is paramount. Over the years, several Mathematical Optimization techniques in Operations Research (OR) specifically, have been developed to help with these class of problems with a good amount of success recorded. Nonetheless, there still remains a great room for improvement on these. Classical approaches to solving assignment problems, among others include the well revered Linear Programming techniques.

1.2 Motivation

The University Timetable Problem: This study, though it doesn't directly proffer a solution to this problem, it attempts to solve a simplified variant of it.

In Universities, there are usually a good number of students taking courses from

a large pool, and in varying mixes, based on Faculty and Institutional requirements. Typically, there are limited facilities such as lecture halls to assign to each course. The problem therefore arises in creating an examination timetable that caters to all the courses, eliminating, or at least minimizing stress and ensuring usability of the timetable.

Studies show that, in order to prepare a well usable timetabling system, provision has to be made for such considerations as the following parameters:

1. Time Clash: A student group cannot have more than one exam at one time
2. Semester Clash: Student groups from the same major but in different semesters cannot have exams at the same time
3. Core Papers: A student group cannot take more than one core exam a day
4. Daily Maximum: A student group cannot have more than one exam per day
5. Difficulty Level: A student group cannot have two difficult exams in two consecutive days
6. Capacity: The total number of students seating for exams in a particular time cannot exceed predefined limits
7. One-period Execution: Each course must occur at the same time for all student groups
8. Periodic Unavailability: Some exams may not be scheduled at particular time slots
9. Comprehensiveness of Coverage: All exams on the timetable have to be assigned
10. Pre-assignment Capabilities: A course may be assigned to a particular target time slot
11. Controllable Exams Conclusion: Student in all student groups should conclude their exams at approximately the same time

The foregoing attributes have been cited as some of the desirable properties of a credible timetabling system. Proffering credible solutions to the timetabling problem has been a major challenge in the wide, that annually, the International Timetabling Competition 2019 [ITC, 2019] holds to select a number of outstanding solutions to the timetabling problem.

Although several aspects of this problem have been attempted over the years, it is still a long way from being efficiently solved to tackle the highlighted problems

This study takes a whole new look at Mathematical Optimization: what if our optimization goal doesn't involve minimizing (or maximizing) any variable or group of variables such as cost, profit, or even price? What if we're on the other hand interested in

*Allocation of objects to non-intersecting groups, based on
attributes possessed by the objects, and one or more
constraining conditions*

Mathematical Optimization techniques, have not been formulated to solve problems as this, and thus the motivation for this study.

1.3 A Reduction Problem

Consider the following problem statement: In deploying intending NYSC members to a serving state, the following constraints need be satisfied:

1. State of Origin: No student should be deployed to his/her state of origin
2. State of Study: No student should be deployed to his state of study
3. Comprehensiveness of Coverage: All enlisted students must be deployed
4. Capacity: No state should be allocated more students that it has resources to accommodate

The foregoing problem statement is an attempt at reducing the more complex University Timetabling problem to a simpler form where the parameters involved are better appreciated. This study focuses on resolving the simpler NYSC batching problem, and makes recommendations on applying the concepts herein in tackling the more complex University Timetabling Problem.

1.4 Objective

The aim of this study is to:

- (i) Develop a mathematical algorithm to solve assignment problems involving the distribution of candidate objects into non-overlapping groups, putting into considerations several constraining conditions
- (ii) Create a simulation, exercising this model on a sample problem
- (iii) Sketch a path to evolving this class of solution to more complex University Timetabling problem, owing to its more complex constraints formulation.

1.5 Definition of Terms and Concepts

1.5.1 Fuzzy Set Theory

Since its inception in 1965, the theory of fuzzy sets has advanced in a variety of ways and in many disciplines. Applications of this theory can be found, for example, in artificial intelligence, computer science, medicine, control engineering, decision theory, expert systems, logic, management science, operations research, pattern recognition, and robotics. Mathematical developments have advanced to a very high standard and are still forthcoming to day. In this review, the basic mathematical framework of fuzzy set theory will be described.

We begin with a definition of the Fuzzy Set Theory:

If X is a nonempty collection of objects denoted generically by x_1, x_2, \dots, x_n for $n = 1, 2, \dots$, then a fuzzy set A in X is a pair

$$(A, \mu_A)$$

where $A \subset X$ and $\mu_A: \mathbf{R} \rightarrow [0, 1]$, called the membership

function of A [\[Lee, 2005\]](#)

Examples of Fuzzy Sets

To better understand the concept of Fuzzy Sets, let us consider the following Examples

Example 1: Let us define a fuzzy set

$$A = \{ x \mid x \in \mathbf{R}, \text{ real numbers near } 0 \}$$

The boundary for set real number near 0 is pretty ambiguous. The possibility of real number x to be a member of prescribed set can be defined by the following membership function.

We define the membership function

$$\mu_A: \mathbf{R} \rightarrow [0, 1]$$

Defining the membership of elements of \mathbf{R} in \mathbf{A}

Defined as:

$$\mu_A(x) = \frac{1}{1 + x^2} \tag{1.1}$$

Example 2: Let us define a similar fuzzy set

$$B = \{ x \mid x \in \mathbb{R}, \text{ real numbers very near } 0 \}$$

We define the membership function

$$\mu_B: \mathbb{R} \rightarrow [0, 1]$$

Defining the membership of elements of \mathbb{R} in \mathbf{B} such that:

$$\mu_B(x) = \left(\frac{1}{1+x^2} \right)^2 \quad (1.2)$$

The Theory of Fuzzy Sets forms the basic framework upon which the solution proposed by this work is formulated

1.5.2 Membership Probability or Degree

Each assignable object in all cases studied in this text, belong to each assignable slot with varying degrees of membership, usually a value in the interval $[0,1]$. An object with a membership degree of 0 is referred to as unfit for the class, while an object have a higher value has a better fit, with the value of 1 being a perfect fit into the class in question.

1.5.3 Partition

Let X be a set, and A_1, A_2, \dots, A_n be subsets of sets such that $A_1 \cap A_2 \cap \dots \cap A_n = \emptyset$ and $A_1 \cup A_2 \cup \dots \cup A_n = X$. The disjoint sets A_1, A_2, \dots, A_n are referred to as a *partition* of the set X

Chapter 2

Literature Review

Finding mathematical solutions to optimization problems has had a long history in coming. This becomes imperative when the problems become enormous both in terms of volume and dimension, where contraction isn't easily achieved based on popular heuristics.

In mathematics, computer science and operations research, mathematical optimization or mathematical programming is the selection of a best element (with regard to some criterion) from some set of available alternatives. [Arjang and Saul, 2011]

In Operations Research, applied mathematics and theoretical computer science, combinatorial optimization is a topic that consists of finding an optimal object from a finite set of objects. [Schrijver, 2017]

Operations research (OR) had its origins in the late 1930s when a group of British Royal Air Force officers and civilian scientists were asked to determine how recently developed radar technology could be used for controlled interception of enemy aircraft. [Arjang and Saul, 2011]. Several successful outcomes were attributed to this collaboration which also promulgated into developing strategies for the World War II, hence the popular remark that *OR helped the Allied forces win the war* [Arjang and Saul, 2011]. At the end of WWII, the U.S. military services, recognizing the wartime contributions of OR, continued their support of OR groups with the problems now focused on logistics, combat modeling, and force planning. Similarly, senior scientists who had participated in wartime OR in the U.K and U.S. were convinced that OR could be used to solve management and operational problems of nonmilitary enterprises and government [Arjang and Saul, 2011].

2.1 Linear Programming (LP)

As highlighted above, Linear Programming techniques often lend themselves to making optimum resource allocation in many cases. The following definition accurately captures these techniques:

Linear Programming is a mathematical technique for determining the optimal allocation of resources and obtaining a particular objective (i.e., cost minimization or inversely profit maximization) when there are alternative uses of resources:

Land, Capital, Materials, Machines, etc

[Sanchetti and Kapoor, 2010]

Solving an assignment problem with Linear Programming techniques, often requires a clear statement of an Objective function, resources constraints, usually expressed as a set of multivariate linear equations.

2.1.1 Typical LP Problems

Three problems have become classical illustrations in Linear Programming: [Sanchetti and Kapoor, 2010]

1. **The Diet Problem:** It is the problem of deciding how much of 'n' different foods to include in a diet, given the cost of each food, and the particular combination of nutrients each food contains. The objective is to minimize the cost of the diet such that it contains a certain minimum amount of each nutrient.
2. **Optimal Product Lines Problem:** How much of 'n' different products a firm should produce and sell. When each product requires a particular combination of labour, machine, time and warehouse space per unit of output and where there are fixed limits on the amounts of labour, machine-time and warehouse space available?
3. **Transportation Problem:** It is a problem of determining a shipping schedule for a commodity, say, steel or oil, from each of a number of plants (or oil-fields) at different locations to each of a number of markets (or refineries) at different locations in such a way as to minimize the total shipping cost subject to the constraints that (1) the demands at each market (refinery) will be satisfied, and (2) the supply at the plant (oil field) will not be exceeded.

Other classifications include the Homemaker's Problem, Blending Problem, On-the-Job Training Problem, etc. [Dantzig and Thapa, 1997, Dantzig and Thapa, 2003]

The general formulation of a Linear Programming problem is given below:

Let Z be a linear function defined by

$$Z = c_1x_1 + c_2x_2 + \dots + c_nx_n$$

where c_j 's are constants

Let (a_{ij}) be mn constants and let (b_i) be a set of m constants

such that

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n (\leq, =, \geq) b_1$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n (\leq, =, \geq) b_2$$

.

.

.

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n (\leq, =, \geq) b_m$$

$$x_1 \geq 0, x_2 \geq 0, \dots, x_n \geq 0$$

[Sanchetti and Kapoor, 2010]

The problem of determining the values of x_1, x_2, \dots, x_n , which makes Z a minimum (or maximum) and which satisfies (ii) and (iii) is called the General Linear Programming Problem

Indeed, linear programming forms the hinge in the history of combinatorial optimization. [Schrijver, 2001]. Linear Programming techniques, as well as other Mathematical Optimization techniques have been reputed a great success, nonetheless, there are several yet unaddressed aspects of optimization problems, one of which, as introduced in the previous chapter, is the focus of this text.

Chapter 3

The Algorithm

3.1 Defining of Resources and Objects

In this section we shall proceed to develop the algorithm needed to solve the reduction problem proposed in the previous section.

Let the set (U) be a collection of objects to be assigned to partitioning sets

$$\mathbb{U} = \{u_1, u_2, \dots, u_n\} \quad (3.1)$$

where each $u_i, i = 1, 2, \dots, n$ are the objects possessing characteristics to be assigned to various partition classes, e.g say, the group of graduates to be posted to NYSC serving states

And let

$$p_1, p_2, \dots, p_k \quad (3.2)$$

be the partitions to which objects u_i 's are to be assigned. We observe that there are k such classes, eg, each p_i would be a state where graduates can be posted to for their Service Year

3.2 Adjusting for Capacities

We now let

$$J(p_i) = j_i \quad (3.3)$$

be the maximum capacity the partition p_i can contain. That is, the maximum number of u_i 's each partition p_i can contain

Let V ,

$$V = \sum_{i=1}^k J(p_i) = \sum_{i=1}^k j_i \quad (3.4)$$

be the total capacity of the system, that is, the total number of u_i 's all the partitions can contain combined.

NB: It should be noted that for an optimum solution to be feasible, $|U| \leq V$ needs be satisfied

We now define the weight, w_i of each partition p_i

$$w_i = \frac{j_i}{V} = \frac{J(p_i)}{\sum_{i=1}^k J(p_i)} \text{ for } i=1,2,3,\dots,k \quad (3.5)$$

The weight, w_i represents the proportion of each p_i 's capacity in the whole

We now define the expected cardinality, $|p_i|$ of each partition p_i

$$|p_i| = w_i \cdot |U| = w_i \cdot n, \text{ for } i=1,2,3,\dots,k \quad (3.6)$$

The cardinality, $|p_i|$ represents the number of objects proportionately assignable to each partition p_i

3.3 Working with the Constraints

We now proceed to define constraints functions, akin to membership function of a Fuzzy Set. But in this case, they membership functions are of two types: inclusion and exclusion types.

Inclusion Constraints require that the value of a characteristic measured on candidate objects, u_i match that prescribed by the constraints, while on the other hand, Exclusion constraints define characteristics that once a candidate object u_i possesses, it is disqualified (by assigning a value of 0) from being a probable member of the partition in question

Constraints, like membership functions, are generally of the form

$$\mu: U \mapsto [0,1]$$

Inclusion Constraints are defined thus:

$$\mu_j(u_i) = \frac{1}{1 + (j - s(u_i))^2} \quad (3.7)$$

And, Exclusion Constraints are defined thus:

$$\mu_j(u_i) = \frac{(j - s(u_i))^2}{1 + (j - s(u_i))^2} \quad (3.8)$$

for $i=1,2,\dots,n$ and $j=1,2,\dots,k$
and

$$s: U \mapsto \{1, 2, \dots, k\} \quad (3.9)$$

is a helper function defined by the individual Constraint function, μ_j to get the index of the partition class p_j with which each object u_i shares the characteristic being measured

For instance, if s is the state of origin helper function, it returns the index of the partition class p_i to which the object u_i maps as a state of origin

NB: p_1, p_2, \dots, k are indexed based on proximity or similarity. That is, the difference between the indices of any two partitions is directly proportional to the distance between them.

Now, in situations where there are more than one Constraint functions defined, we obtain a single Constraint function by multiplying through viz:

$$\mu_i(u_j) = \prod_{t=1}^s \mu_{i_t}(u_j) \quad (3.10)$$

for $i=1, 2, \dots, k$; $j=1, 2, \dots, n$ and s is the total number of Constraint functions defined

We now define the membership set for each partition. These sets list the probability of each object u_i being a member of the partition p_j

$$\mu_i = \{\mu_i(u_1), \mu_i(u_2), \dots, \mu_i(u_n)\} \quad (3.11)$$

So, for example

$$\mu_1 = \{\mu_1(u_1), \mu_1(u_2), \dots, \mu_1(u_n)\} \quad (3.12)$$

and,

$$\mu_2 = \{\mu_2(u_1), \mu_2(u_2), \dots, \mu_2(u_n)\} \quad (3.13)$$

and,

$$\mu_3 = \{\mu_3(u_1), \mu_3(u_2), \dots, \mu_3(u_n)\} \quad (3.14)$$

\vdots

$$\mu_k = \{\mu_k(u_1), \mu_k(u_2), \dots, \mu_k(u_n)\} \quad (3.15)$$

3.4 Assigning the Objects

We now proceed to populate each partition with the objects with the highest membership probability, in turn

Let

$$\mu_{p_i} = \mu_i \setminus \bigcup_{j=1}^{i-1} \{\mu_j(u_x) \forall u_x \in p_j\} \quad (3.16)$$

That is, isolating the already assigned objects u_x from the membership set to avoid multiple membership

Now, sorting out the first $|p_k|$ objects with the highest membership points:
Let

$$Q_1 = u_x \mid \mu_i(u_x) = \max \{\mu_{p_i}\} \quad (3.17)$$

And

$$Q_2 = u_x \mid \mu_i(u_x) = \max \{\mu_{p_i} \setminus \mu_i(u_y) \mid u_y \in Q_1\} \quad (3.18)$$

And

$$Q_3 = u_x \mid \mu_i(u_x) = \max \left\{ \mu_{p_i} \setminus \mu_i(u_y) \mid u_y \in Q_1 \bigcup Q_2 \right\} \quad (3.19)$$

And

$$Q_4 = u_x \mid \mu_i(u_x) = \max \left\{ \mu_{p_i} \setminus \mu_i(u_y) \mid u_y \in Q_1 \bigcup Q_2 \bigcup Q_3 \right\} \quad (3.20)$$

\vdots

$$Q_{|p_i|} = u_x \mid \mu_i(u_x) = \max \left\{ \mu_{p_i} \setminus \bigcup_{j=1}^{|p_i|-1} \{\mu_i(u_y) \mid u_y \in Q_j\} \right\} \quad (3.21)$$

Whence we finally have that

$$p_i = \bigcup_{j=1}^{|p_i|} \{Q_j\} \quad \text{for } i=1, 2, \dots, k \quad (3.22)$$

Chapter 4

Solving A Sample Problem

In this section, we attempt to apply the algorithm developed in the previous chapter to solve a sample problem. The problem is an attempt to assign a group of 20 University graduates to one of 5 states for service.

4.1 Statement of Constraints

1. No students should be posted to their State of Origin
2. No students should be posted to their States of study
3. The maximum capacity of each state must not be exceeded
4. All students should be assigned

The 3rd and 4th constraints are innately adhered to by the algorithm, so we'll focus only on constructing Constraint Functions for the first two constraints.

4.2 The States

The States in this problem stand for the partitions to be filled. In order to simplify the problem, we focus only on 5 states and assume each of the 20 graduates schooled in one of these and originated from one of these states. The data represented here is in the form {State,Capacity}

1. p_1 : {Osun State, 3}
2. p_2 : {Kwara State, 2}
3. p_3 : {Enugu State, 1}

4. p_4 : {Akwa-Ibom State, 5}
5. p_5 : {Kano State, 10}

4.3 The Graduates

Each graduate has a number of characteristics which include names, State of origin, and Alma Mater. Here is our list of 20 graduates which we shall consider in this sample problem - {Name,State of Origin,School}:

1. u_1 : {GR01, Kwara(2), OAU(1)}
2. u_2 : {GR02, Kwara(2), BUK(5)}
3. u_3 : {GR03, Kwara(2), NSUKKA(3)}
4. u_4 : {GR04, Kwara(2), UNILORIN(2)}
5. u_5 : {GR05, Akwa-Ibom(4), OAU(1)}
6. u_6 : {GR06, Akwa-Ibom(4), BUK(5)}
7. u_7 : {GR07, Akwa-Ibom(4), NSUKKA(3)}
8. u_8 : {GR08, Akwa-Ibom(4), UNILORIN(2)}
9. u_9 : {GR09, Osun(1), OAU(1)}
10. u_{10} : {GR10, Osun(1), BUK(5)}
11. u_{11} : {GR11, Osun(1), NSUKKA(3)}
12. u_{12} : {GR12, Osun(1), UNILORIN(2)}
13. u_{13} : {GR13, Kano(5), OUI(1)}
14. u_{14} : {GR14, Kano(5), NSUKKA(3)}
15. u_{15} : {GR15, Kano(5), UNILORIN(2)}
16. u_{16} : {GR16, Kano(5), AKSU(4)}
17. u_{17} : {GR17, Enugu(3), UNIOSUN(1)}
18. u_{18} : {GR18, Enugu(3), BUK(5)}
19. u_{19} : {GR19, Enugu(3), UNILORIN(2)}
20. u_{20} : {GR20, Enugu(3), AKSU(4)}

4.4 States - Capacity, Weights and Cardinality

As indicated in the States data, each state has a capacity, j_i . So in this case,

$$J(p_1) = j_1 = 3$$

$$J(p_2) = j_2 = 2$$

$$J(p_3) = j_3 = 1$$

$$J(p_4) = j_4 = 5$$

$$J(p_5) = j_5 = 10$$

Thus, the maximum capacity of the system is given as:

$$V = \sum_{i=1}^5 J(p_i) = 3 + 2 + 1 + 5 + 10 = 21 \quad (4.1)$$

Since V is less than the total number of graduates awaiting deployment (20), a feasible assignment is possible.

The weight, w_i of each state is defined thus:

$$w_i = \frac{j_i}{V}, \quad \text{for } i=1,2,\dots,5 \quad (4.2)$$

$$w_1 = \frac{j_1}{V} = \frac{3}{21} = 0.143 \quad (4.3)$$

$$w_2 = \frac{j_2}{V} = \frac{2}{21} = 0.095 \quad (4.4)$$

$$w_3 = \frac{j_3}{V} = \frac{1}{21} = 0.048 \quad (4.5)$$

$$w_4 = \frac{j_4}{V} = \frac{5}{21} = 0.238 \quad (4.6)$$

$$w_5 = \frac{j_5}{V} = \frac{10}{21} = 0.476 \quad (4.7)$$

We now define the expected cardinality, $|p_i|$ of each state. That is, the expected number of Corp members posted to each state

$$|p_i| = w_i \cdot \text{no. of graduates} = w_i \cdot n = w_i \cdot 20, \quad \text{for } i=1,2,\dots,5 \quad (4.8)$$

$$|p_1| = w_1 \times 20 = 0.143 \times 20 = 2.86 \approx 3 \quad (4.9)$$

$$|p_2| = w_2 \times 20 = 0.095 \times 20 = 1.9 \approx 2 \quad (4.10)$$

$$|p_3| = w_3 \times 20 = 0.048 \times 20 = 0.96 \approx 1 \quad (4.11)$$

$$|p_4| = w_4 \times 20 = 0.238 \times 20 = 4.76 \approx 5 \quad (4.12)$$

$$|p_5| = w_5 \times 20 = 0.476 \times 20 = 9.52 \approx 9 \quad (4.13)$$

4.5 Constraints

The sample problem has two statements of exclusion constraints. We will establish the Constraint functions defining the membership probability of each graduate into each state thus:

Constraint A, μ_A : No student should be posted to their State of Origin

$$\mu_{A_j}(u_i) = \frac{(j - s_A(u_i))^2}{1 + (j - s_A(u_i))^2} \quad (4.14)$$

where $\mu_{A_j}(u_i)$ measures the degree of object u_i 's membership in State j under the consideration of the *state of origin* constraint and, $s_A(u_i)$ represents the index of graduate u_i 's State of Origin

$$\begin{aligned} \mu_{A_1}(u_1) &= \frac{(1 - s_A(u_1))^2}{1 + (1 - s_A(u_1))^2} \\ &= \frac{(1 - 2)^2}{1 + (1 - 2)^2} \\ &= 0.5 \end{aligned} \quad (4.15)$$

$$\begin{aligned} \mu_{A_1}(u_2) &= \frac{(1 - s_A(u_2))^2}{1 + (1 - s_A(u_2))^2} \\ &= \frac{(1 - 2)^2}{1 + (1 - 2)^2} \\ &= 0.5 \end{aligned} \quad (4.16)$$

$$\begin{aligned} \mu_{A_1}(u_3) &= \frac{(1 - s_A(u_3))^2}{1 + (1 - s_A(u_3))^2} \\ &= \frac{(1 - 2)^2}{1 + (1 - 2)^2} \\ &= 0.5 \end{aligned} \quad (4.17)$$

The foregoings, based on the first constraint, calculates the degree of membership of each object(graduate) u_i in each state

In a similar manner, we proceed to calculate the degree of membership of each object(graduate) in each state.

Constraint B, μ_B : No student should be posted to their State of Studies

$$\mu_{B_j}(u_i) = \frac{(j - s_B(u_i))^2}{1 + (j - s_B(u_i))^2} \quad (4.115)$$

where $\mu_{B_j}(u_i)$ measures the degree of object u_i 's membership in State j under the consideration of the *state of origin* constraint and, $s_B(u_i)$ represents the index of graduate u_i 's State of Study

$$\begin{aligned} \mu_{B_1}(u_1) &= \frac{(1 - s_B(u_1))^2}{1 + (1 - s_B(u_1))^2} \\ &= \frac{(1 - 1)^2}{1 + (1 - 1)^2} \\ &= 0 \end{aligned} \quad (4.116)$$

$$\begin{aligned} \mu_{B_1}(u_2) &= \frac{(1 - s_B(u_2))^2}{1 + (1 - s_B(u_2))^2} \\ &= \frac{(1 - 2)^5}{1 + (1 - 5)^2} \\ &= 0.94 \end{aligned} \quad (4.117)$$

$$\begin{aligned} \mu_{B_1}(u_3) &= \frac{(1 - s_B(u_3))^2}{1 + (1 - s_B(u_3))^2} \\ &= \frac{(1 - 3)^2}{1 + (1 - 3)^2} \\ &= 0.80 \end{aligned} \quad (4.118)$$

&= 0.50
\end{aligned} \tag{4.215}$$

Now, Since our sample problem set defines two Constraints, $\mu_{A_i}(u_j)$ and $\mu_{B_i}(u_j)$ for $i=1,2,\dots,5$ and $j=1,2,\dots,20$,

We will now proceed to estimate a single membership probability $\mu_i(u_j)$ for $i=1,2,\dots,5$ and $j=1,2,\dots,20$, which is estimated by the following:

$$\mu_i(u_j) = \mu_{A_i}(u_j) \cdot \mu_{B_i}(u_j) \quad (4.216)$$

$$\begin{aligned} \mu_1(u_1) &= \mu_{A_1}(u_1) \cdot \mu_{B_1}(u_1) \\ &= 0.50 \times 0 \\ &= 0 \end{aligned} \quad (4.217)$$

$$\begin{aligned} \mu_1(u_2) &= \mu_{A_1}(u_2) \cdot \mu_{B_1}(u_2) \\ &= 0.50 \times 0.94 \\ &= 0.47 \end{aligned} \quad (4.218)$$

$$\begin{aligned} \mu_1(u_3) &= \mu_{A_1}(u_3) \cdot \mu_{B_1}(u_3) \\ &= 0.50 \times 0.50 \\ &= 0.25 \end{aligned} \quad (4.219)$$

$$\begin{aligned} &\vdots \\ \mu_3(u_4) &= \mu_{A_3}(u_4) \cdot \mu_{B_3}(u_4) \\ &= 0.50 \times 0.80 \\ &= 0.40 \end{aligned} \quad (4.220)$$

$$\begin{aligned} &\vdots \\ \mu_5(u_{20}) &= \mu_{A_5}(u_{20}) \cdot \mu_{B_5}(u_{20}) \\ &= 0.80 \times 0.50 \\ &= 0.40 \end{aligned} \quad (4.221)$$

$$(4.222)$$

Which we can more concisely represent in the following sets:

$$\mu_i = \{\mu_i(u_1), \mu_i(u_2), \mu_i(u_3), \dots, \mu_i(u_{20})\} \quad \text{for } i=1,2,\dots,5 \quad (4.223)$$

So that

$$\begin{aligned} \mu_1 &= \{\mu_1(u_1), \mu_1(u_2), \mu_1(u_3), \dots, \mu_1(u_{20})\} \\ &= \{0, 0.47, 0.40, \dots, 0.90\} \end{aligned} \quad (4.224)$$

$$\begin{aligned} \mu_2 &= \{\mu_2(u_1), \mu_2(u_2), \mu_2(u_3), \dots, \mu_2(u_{20})\} \\ &= \{0, 0, 0, \dots, 0.40\} \end{aligned} \quad (4.225)$$

$$\begin{aligned} \mu_3 &= \{\mu_3(u_1), \mu_3(u_2), \mu_3(u_3), \dots, \mu_3(u_{20})\} \\ &= \{0.40, 0.40, 0, \dots, 0\} \end{aligned} \quad (4.226)$$

$$\begin{aligned} \mu_4 &= \{\mu_4(u_1), \mu_4(u_2), \mu_4(u_3), \dots, \mu_4(u_{20})\} \\ &= \{0.40, 0.40, 0.40, \dots, 0\} \end{aligned} \quad (4.227)$$

$$\begin{aligned} \mu_5 &= \{\mu_5(u_1), \mu_5(u_2), \mu_5(u_3), \dots, \mu_5(u_{20})\} \\ &= \{0.84, 0, 0.72, \dots, 0.40\} \end{aligned} \quad (4.228)$$

Summarized fully in the table below:

Table 4.3: The Membership Degree Distribution for the Sample Assignment Problem, III of III

4.6 Populating the States(Partitions)

Having achieved a well defined membership probability for each of the graduates into each of the states, in the previous section, we now proceed to assigning the most qualifying candidates to each state, while not exceeding each State's defined expected partition size, capacity that is. Recall that from eq(4.9) to eq(4.18), we defined the expected assignment size of each state to be:

$$|p_1| = 3$$

$$|p_2| = 2$$

$$|p_3| = 1$$

$$|p_4| = 5$$

$$|p_5| = 9$$

Now, for each State, p_i , we select the first $|p_i|$ candidates, u_j with the highest membership $\mu_i(u_j)$ probability in order, for each State $i=1,2,...,5$:

$$p_1 = \{u_6(0.85), u_{16}(0.84), u_{14}(0.74)\} \quad (4.229)$$

$$p_2 = \{u_{10}(0.45), u_{13}(0.45)\} \quad (4.230)$$

$$p_3 = \{u_9(0.64)\} \quad (4.231)$$

$$p_4 = \{u_{12}(0.72), u_4(0.64), u_{11}(0.45), u_{17}(0.45), u_1(0.45)\} \quad (4.232)$$

$$p_5 = \{u_3(0.72), u_{19}(0.72), u_8(0.45), u_5(0.47), u_7(0.40), u_{20}(0.40), u_2(0), u_{18}(0), u_{15}(0)\} \quad (4.233)$$

After successfully applying the algorithm developed in the previous section to make the assignment on the sample problem, we have been able to reach an assignment explained thus:

4.6.1 The Assignment Table

Name	State of Origin	College	Posting	Membership Degree
GR06	Akwa-Ibom	BUK, Kano	Osun	85%

Chapter 5

Discussion and Conclusion

5.1 Discussion of Results

From the assignment achieved in the previous Chapter, the total optimal assignment is 17 out of 20, which is a score of 85%, with an average membership score of 51.6%. This algorithm can be assessed to have performed good on the task, nonetheless, we point several points of possible improvements that can be explored to enhance the result.

5.2 Improvement Suggestions

Although, the sample problem outlined in the previous chapter got a 85% assignment accuracy, by making a few adjustments, we observe that the accuracy could be raised as high as 100%

- When choosing objects into each partition, keep a tab on the number of non-zero assignable members left for each class, if this number is equal to the expected partition size of any class, proceed to make assignments into the class in question. This precaution ensures that each class gets the opportunity to get the maximum number assignments with fitness value different from zero.
- As would be observed, the assignment of probabilities to each partition proceeds partition-wise, that is, iterating from partition to partition and filling them up in turn with the highest-probability member. We also exercised the member-wise assignment, that is, iterating through each object, and assigning each based on its highest probability, taking caution not to

exceed the partition width. Putting this method to practise improved the assignment from 85% to 90%, which is a significant improvement.

- As cited in the previous point, several routes can be taken to assign objects to the appropriate partitions. Since the candidate-wise iteration introduces some improvements to the assignment, we would investigate further to identify a 'hybrid' algorithm which combines both partition-based and object-based algorithm to make assignment, and this promises to further raise the accuracy level of the assignment schedule.

5.3 Further Work

As must have observed in the algorithm designed in this text, an attempt was made to solve a simplified version of the University Timetabling problem. Here, the Constraints are of a simpler construct with no inter-constraint interaction. Such that, by simply multiplying out the individual constraints, we were able to estimate the degree of membership of each object in each partition. In the case of the University Timetabling problem, several constraints have more complex interactions which may not combine simply by multiplying out. The successful assignmt schedule achieved in this text would be improved to will be further studied.
